AHPS Verification

How good are the ensemble streamflow predictions from the National Weather Service (NWS) Advanced Hydrologic Prediction System (AHPS)? Find out using AHPS Verification. The system takes a retrospective look at the quality (skill, biases, and other measures) of AHPS predictions reconstructed for the past (up to 50 years at some sites). You can delve into details for an individual site, or compare the forecast quality at different sites.

Verification Data Archive

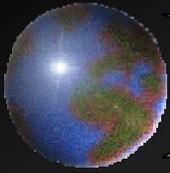

Verification Data Archive

Ensemble Streamflow Predictions

Des Moines River

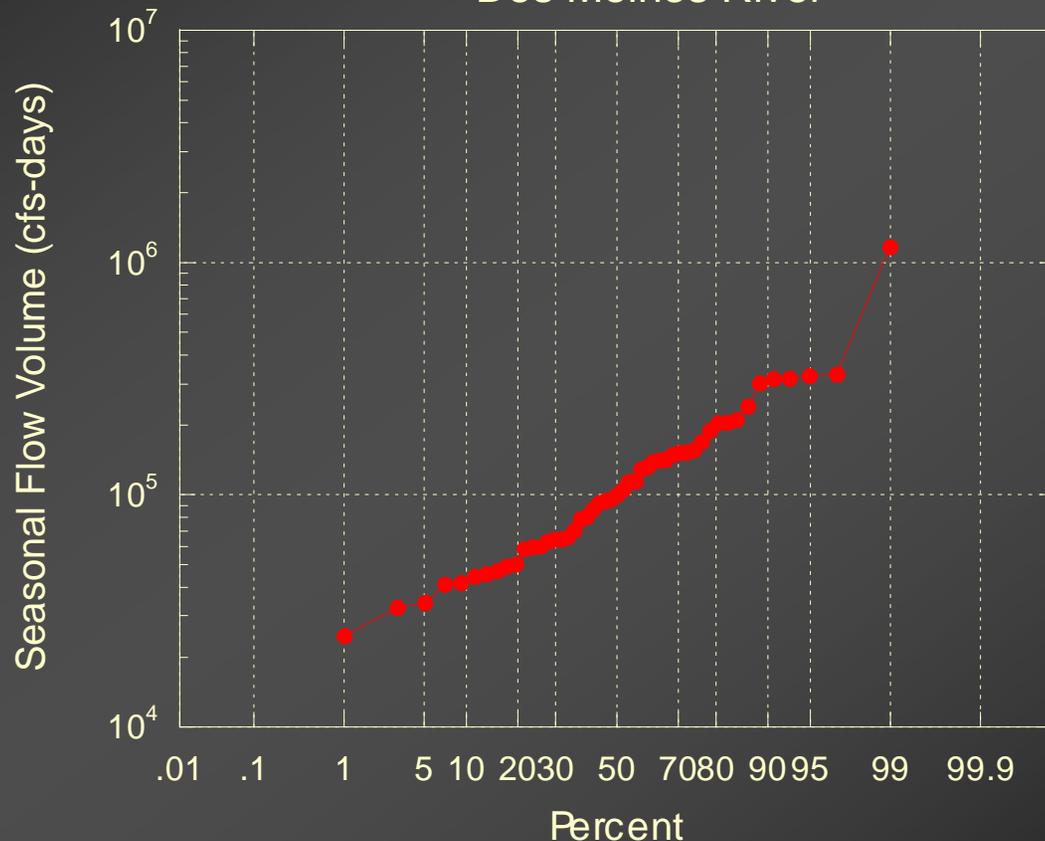

- Retrospective forecasts for a 50-year period

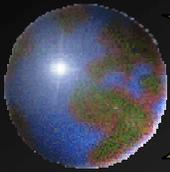

Verification Data Archive

Conditional Distribution Forecast

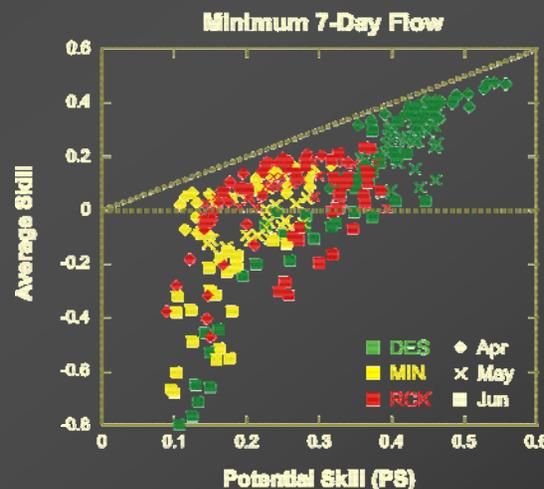

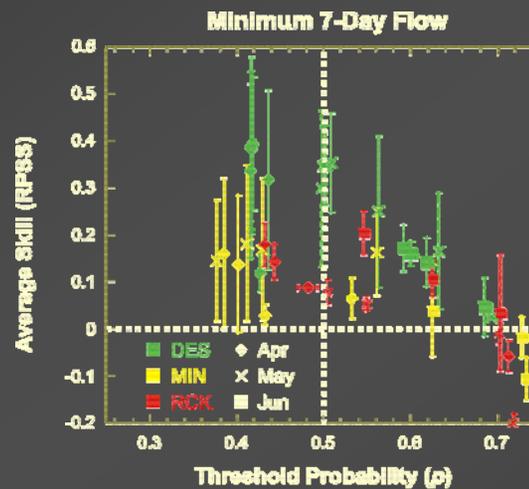

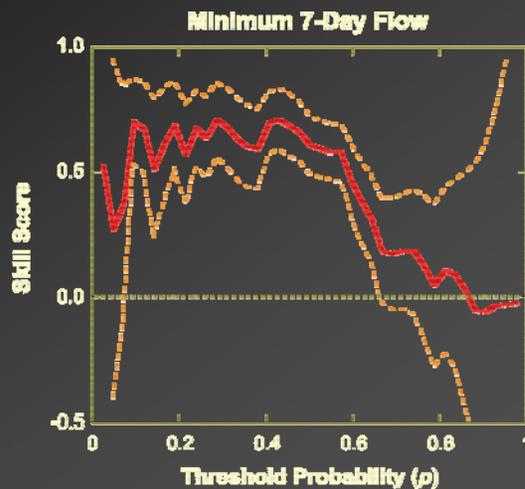

Des Moines River

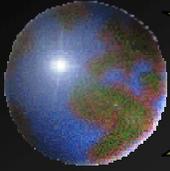

- Retrospective forecasts for a 50-year period
- Processed ensemble forecasts & observations

Verification Data Archive

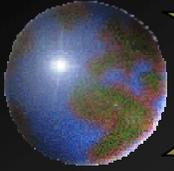

- Retrospective forecasts for a 50-year period
- Processed ensemble forecasts & observations
- Verification results

AHPS Verification Concepts

- Use measures that help **diagnose attributes** (e.g., biases) limiting forecast skill
- Utilize **non-dimensional** measures of forecast quality to allow **comparisons** at many locations or forecast times

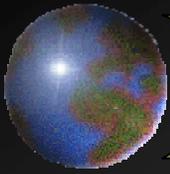

Verification Measures

● Skill

- Accuracy of the forecast relative to another forecasting technique (climatology)

● Bias

- Average differences between forecasts and observations
- Unconditional (overall average) and conditional (depends forecast issued) biases

Distributions-Oriented Measures

- Skill Score Decomposition:

(SS)
Skill

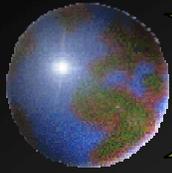

(RES)
Resolution

(CB)
Conditional
Bias

(UB)
Unconditional
Bias

$$SS_{MSE} = \rho_{fx}^2 - \left[\rho_{fx} - \frac{\sigma_f}{\sigma_x} \right]^2 - \left[\frac{\mu_f - \mu_x}{\sigma_x} \right]^2$$

Potential Skill Slope Reliability Standardized Mean Error

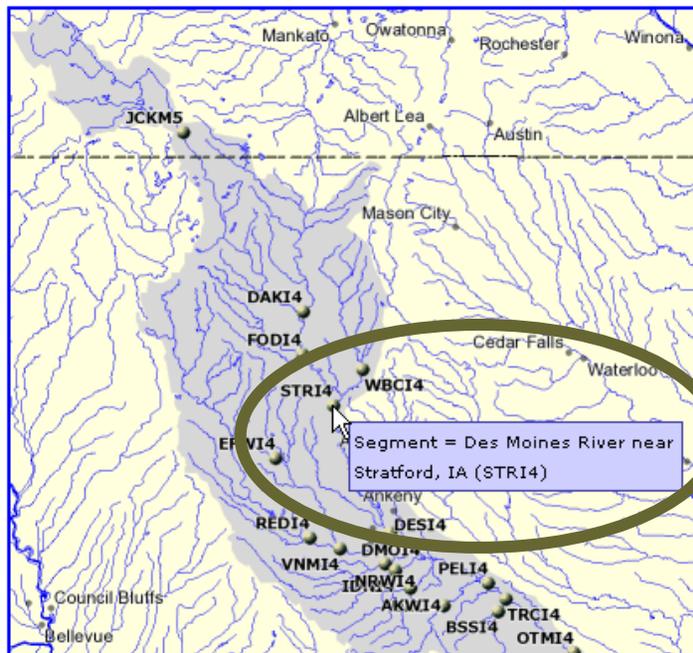

Single Forecast Location/Time

RFC > Forecast Group > **Forecast Segment** > Options > Images

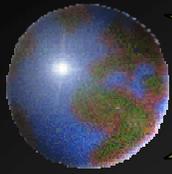

Des Moines

Please select a forecast segment.
You may select more than one forecast segment.

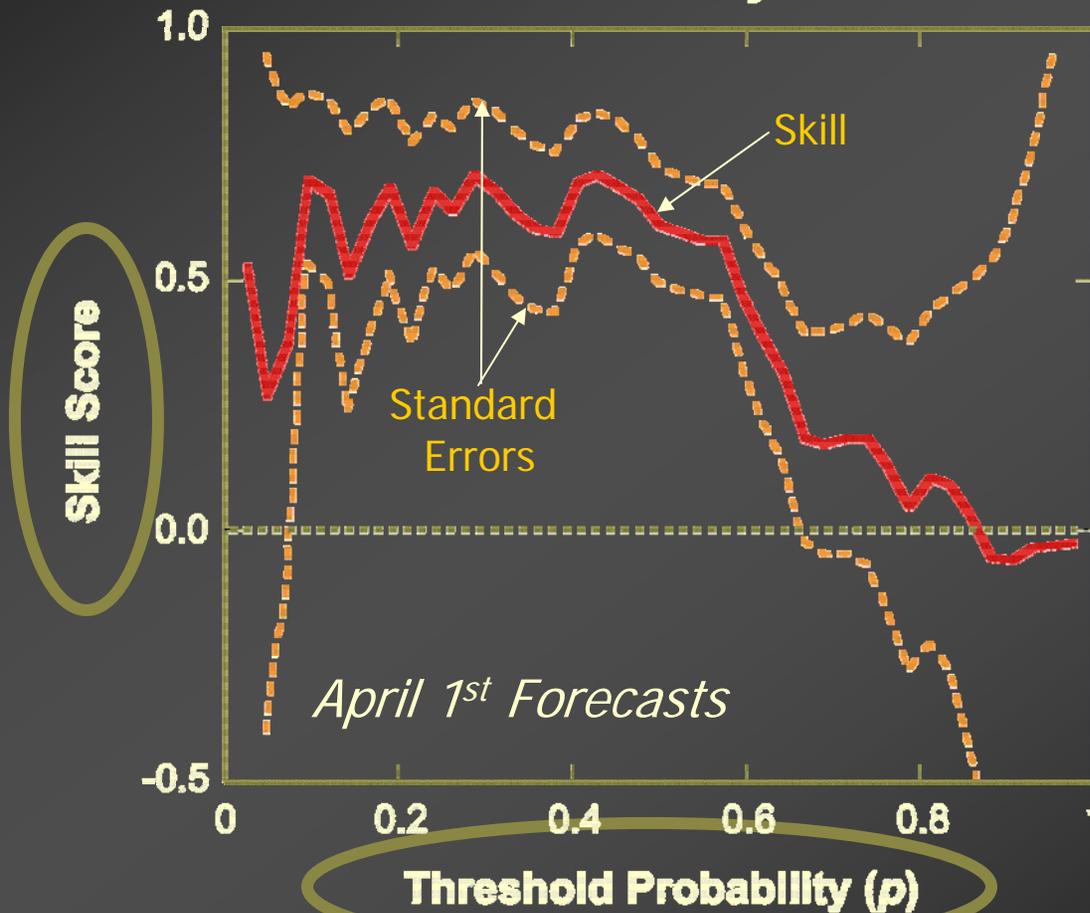

Selected Forecast Segments
STRI4
<input type="button" value="Submit"/> <input type="button" value="Clear List"/>

Low flow forecasts
Minimum 7-day flow
Issued April 1st

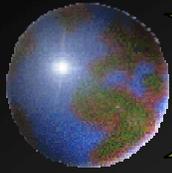

Des Moines River near Stratford

Minimum 7-Day Flow

- Skill depends on the threshold
- Uncertainty is greater for extremes

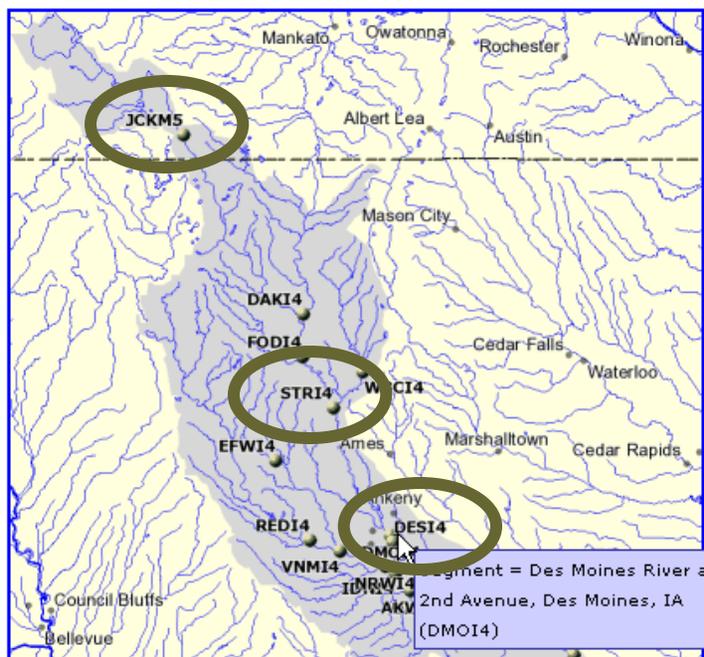

Multiple Forecast Locations/Times

RFC > Forecast Group > Forecast Segment > Options > Images

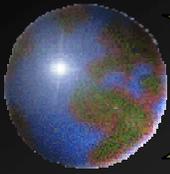

Des Moines

Please select a forecast segment.
You may select more than one forecast segment.

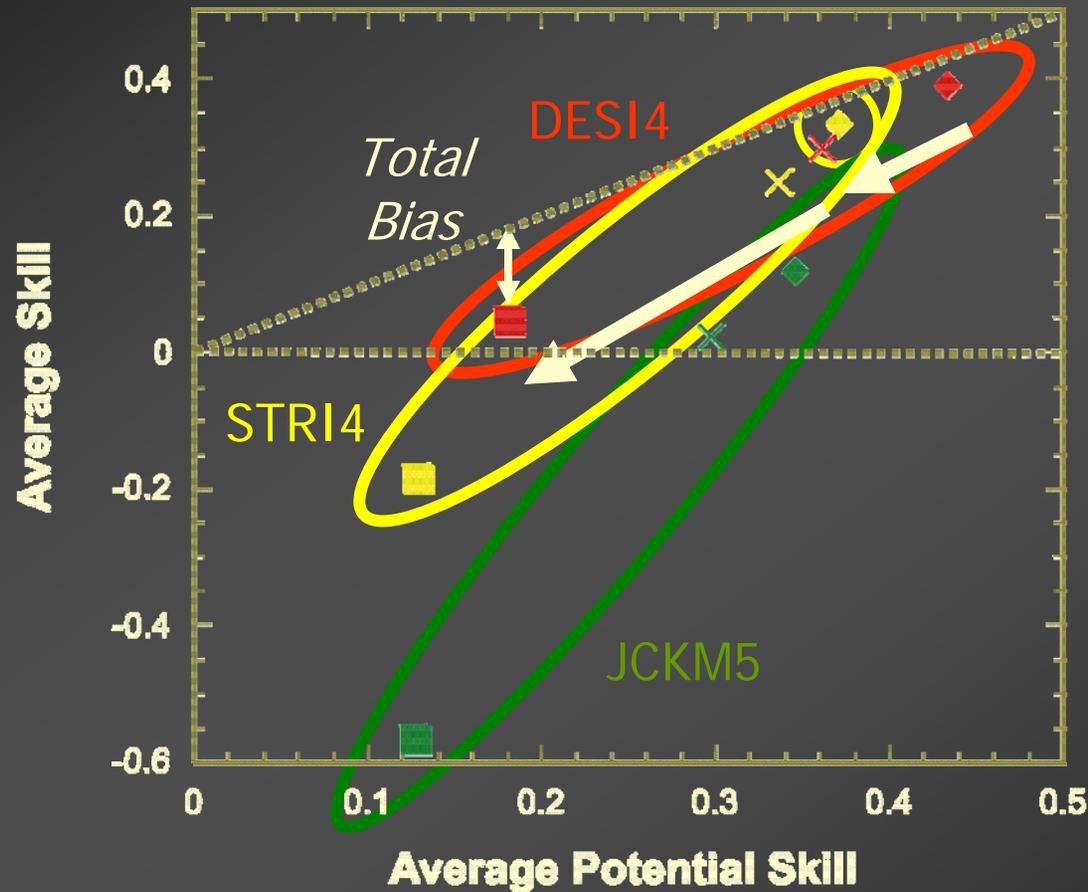

Selected Forecast Segments
JCKM5 + STRI4 + DMO14
<input type="button" value="Submit"/> <input type="button" value="Clear List"/>

Low flow forecasts
Minimum 7-day flow
Issued April to June

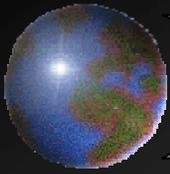

Des Moines Forecast Skill

Minimum 7-Day Flow

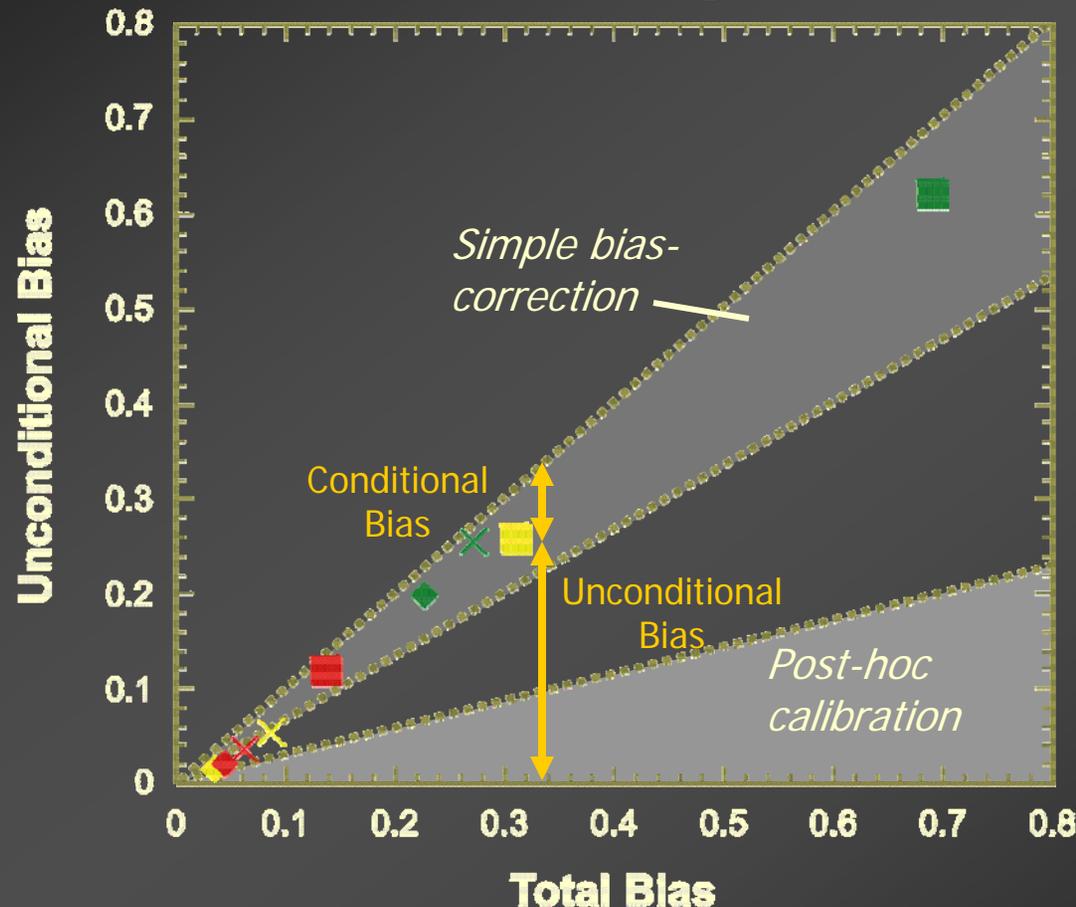

- JCKM5
- STR I4
- DES I4
- ◆ Apr
- × May
- Jun

- Skill is higher (lower) downstream (upstream)
- Skill decline from April to June

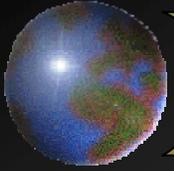

Des Moines Forecast Biases

Mininum 7-Day Flow

- JCKM5
- STR14
- DESI4
- ◆ Apr
- × May
- Jun

- Unconditional bias is dominate
- Simple bias-correction can significantly improve forecasts

Conclusions

- AHPS verification requires:
 - An **archive** of ensemble forecasts (typically retrospective forecasts for a long historical period)
 - **Non-dimensional verification measures** that allow comparisons at multiple sites and forecast periods
 - A **diagnostic framework** to identify opportunities to improve forecasts
