

M-6. run_bounce_postgres

1.0 General Information

1.1 Program Description

This Korn script is for use by user root only. The script shuts down both shefdecoders, stops oper's cron, and stops and restarts the Postgres Engine. It then restarts both shefdecoders and oper's cron.

1.2 Assumptions

This script assumes the RFC maintains all current changes in oper's cron in the file /rfc_arc/crons/adb_oper_crons.

1.3 Enhancements/Bug Fixes/Changes

Build OB7.2

This script replaces the run_bounce_Informix script. It takes into account the upgrade of the OS in ob7.2 and the change in RDBMS from Informix to Postgres. Documentation was updated to reflect these changes.

2.0 User How-To

To run this application:

- ssh ax
- su – root (user must have access to password for user root)
- cd /rfc_arc/scripts/sysadmin
- run_bounce_postgres
- exit (this will return you to your original login user)

3.0 Troubleshooting Information
