38.	Winte	er Storm (Z) A	A-41
39	Winte	er Weather/Mix (Z)	A-41

This Appendix will enable *Storm Data* preparers to properly enter events into the StormDat software program. Special emphasis is placed on expansion of the basic event definition, the beginning and ending times, and the differentiation of direct versus indirect fatalities. In addition, specific examples are given to depict how the event might appear in the *Storm Data* publication. Many of the specific examples were based on actual occurrences, but some of the numbers, names, etc., were changed in order to better illustrate a concept.

There are three designators indicated after the event type: C for County/Parish; Z for Zone; and M for Marine.

<b>Event Name</b>	Designator	<b>Event Name</b>	Designator
Astronomical High Tide	Z	Landslide	Z
Avalanche	Z	Lightning	C
Blizzard	Z	Marine Hail	M
Dense Fog	Z	Marine Thunderstorm Wind	M
Drought	Z	Rip Current	M
Dust Devil	C	Seiche	Z
Dust Storm	Z	Sleet Storm	Z
Excessive Heat	Z	Storm Surge	Z
Extreme Cold/Wind Chill	Z	Strong Wind	Z
Flash Flood	C	Thunderstorm Wind	C
Flood	Z	Tornado	C
Frost/Freeze	Z	Tropical Depression	Z
Funnel Cloud	C	Tropical Storm	Z
Hail	C	Tsunami	Z
Heavy Rain	C	Volcanic Ash	Z
Heavy Snow	Z	Waterspout	M
Heavy Surf/High Surf	Z	Wildfire	Z
High Wind	Z	Winter Storm	Z
Hurricane (Typhoon)	Z	Winter Weather/Mix	Z
Ice Storm	Z		

1. **Astronomical High Tide (Z).** Abnormal, or extremely high tide levels, produced without any unusually heavy surf, that results in a coastal flood.

Beginning Time - When the coastal flooding began.

Ending Time - When the coastal flooding ended.

**Direct Fatalities/Injuries** 

☐ A child wandered into a flooded area and drowned.

Indirect Fatalities/Injuries

A car, driving along a flooded roadway, swerved and crashed into a tree.

#### Example:

#### **GAZ166** Camden Coastal

15 0800EST 0 0 20K Astronomical High Tide 1500EST

Perigean spring tides in combination with onshore winds of 10 to 15 knots produced flooding of Cumberland Island National Seashore, damaging several seaside cabanas.

2. **Avalanche (Z).** A mass of snow, often containing rocks, ice, trees, or other debris, that moves rapidly down a steep slope, resulting in a fatality, injury, or significant damage. If a search team inadvertently starts another avalanche, it will be entered as a new Avalanche event.

Beginning Time - When the snow mass started to descend.

Ending Time - When the snow mass ceased motion.

Direct Fatalities/Injuries

□ People struck by the snow mass or any debris contained within.

□ People struck by debris tossed clear of the avalanche.

□ People buried by the avalanche.

Indirect Fatalities/Injuries

□ People who ran into (in a motor vehicle, on skis, etc.) the snow mass or debris after it stopped moving.

Example:

#### COZ012 West Elk and Sawatch Mountains/Taylor Park

06 1900MST 5 1 Avalanche 1915MST

Four college students were caught in an avalanche, triggered when one of the students crossed a slope just below the summit on Cumberland Pass, which is about 25 miles east-northeast of Gunnison in the Sawatch Mountain Range. The entire slope at the 12,000-foot elevation fractured 6-feet deep and 1500 feet across and ran 400 vertical feet, with the resulting avalanche scouring the slope all the way to the 9,000-foot level. The skier who triggered the avalanche was buried next to a tree which provided an air space that was crucial to his survival. The other three students, including a snowmobiler, a snow-boarder, and another skier, perished in the snow. The avalanche also destroyed a cabin, killing the occupant. Boulders dislodged by the avalanche struck a car, killing the driver. M19OU, M20OU, M22OU, M43PH, F37VE

3. **Blizzard (Z).** A winter storm which produces the following conditions for 3 hours or longer: (1) sustained winds or frequent gusts to 30 knots (35 mph) or greater, and (2) considerable falling and/or blowing snow reducing visibility frequently to less than 1/4 mile.

<u>Beginning Time</u> - When blizzard conditions began. <u>Ending Time</u> - When blizzard conditions ended.

(In *Storm Data*, no blizzard should cover a time period of less than 3 hours. If blizzard conditions occur for less than 3 hours, the event should be entered as Heavy Snow, or Winter Weather/Mix, perhaps noting in the narrative that near-blizzard conditions were observed at the height of the storm.)

Direct 1	Fatalities/Injuries			
	People who became	trapped or c	lisori	iented in a blizzard and died from exposure.
	People who were stru	ack by obje	cts bo	orne or toppled in blizzard wind.
	A roof collapsed due	to the weig	ght of	f snow.
	A vehicle stalled in a	blizzard.	The o	occupant died of exposure.
<u>Indirect</u>	t Fatalities/Injuries			
	Vehicle accidents car	used by poo	or visi	ibility and/or slippery roads.
Example:				
MIZ049-055	Huron - Sanilac			
	02 2200EST 03 0300EST	2	0	Blizzard
visibility to val	A massive low pressure south across the Great snow event in the Thu (40 to 50 mph), with greduced visibilities to Snow accumulations were commonly cited observed. Emanual -	,	S		
Example:				
NCZ053-065	Buncombe - Henders	son		
	30 0400EST 1000EST	0	0	Dense Fog

Dense fog developed in the early morning hours in the French Broad River valley. The fog played havoc with the morning commute, and contributed to several accidents in and south of Asheville. At 0900 EST, the fog contributed to a 25-car pile-up on Interstate 40 on the south side of Asheville. The accident claimed 4 lives (indirect fatalities) and injured 17 (indirect). Asheville Regional Airport was closed for most of the morning. The North Carolina State Police shut down Interstate 26 between the airport and the city as a precautionary measure.

5. **Drought (Z).** A period of abnormally dry weather, sufficiently prolonged, causing a serious hydrologic imbalance (i.e., crop damage, water supply shortage, etc.) in the affected area. Determination of whether or not to include a drought in *Storm Data* and establishment of beginning and ending times can be made using locally defined values.

<u>Beginning Time</u> - When water shortages and/or crop damage due to unusually dry weather became significant.

<u>Ending Time</u> - When hydrologic balance was restored, and/or water supply problems were no longer serious.

**Direct Fatalities/Injuries** 

☐ Extremely rare.

Indirect Fatalities/Injuries

☐ None.

#### Example:

```
NEZ006-011-012- Keya Paha - Knox - Cedar - Thurston - Antelope - Pierce - 015>018-030>034- Wayne - Boone - Madison - Stanton - Cuming - Burt - Platte - 042>045-050-053> Colfax - Dodge - Washington - Butler - Saunders - Douglas - 065>068-078-088> Sarpy - Seward - Lancaster - Cass - Otoe - Saline - Jefferson - Gage - Johnson - Nemaha - Pawnee - Richardson 01 0000CST 0 0 55K Drought 22 1800CST
```

A drought, which began in early September, ended for much of eastern Nebraska, on November 22 when 3 to 5 inches of precipitation fell. For many locations, this was the first significant rain of over a quarter of an inch since September 4. The drought's effect was especially felt during the first 3 weeks of November after numerous grass fires prompted many towns and villages to ban any type of outdoor burning. Among the largest fires reported were: 180-200 acres of grassland and timber near Indian Cave State Park near Falls City, 300 acres of prairie grass east of Wymore, 100 acres of prairie grass near Hickman, 100 acres of a harvested corn field south of Elkhorn, 60 acres of grass north of Omaha, and 40 to 50 acres of grassland near Ashland. The most costly reported fire was when smoldering leaves ignited dry grass near Woodcliff, south of Fremont, eventually spreading to two homes and causing \$55,000 worth of damage. Damage

amounts do not include costs to individual fire departments for fire containment.

<u>Note</u>: This example would have been entered in September and October *Storm Data* as well. Damage amounts in the header are for the current month only. Grand totals for the entire drought episode should be mentioned in the narrative. In some cases the effects and cost of a drought may not be known for some time.

6. **Dust Devil (C).** A vigorous whirlwind, usually of short duration, rendered visible by dust, sand, or other debris picked up from the ground, resulting in a fatality, injury, or significant damage. Dust devils that don't produce a fatality, injury, or damage can be entered if they are unusually large, noteworthy, or create strong public interest.

Beginning Time - When dust, dirt, sand, or debris was first seen in the whirlwind.
 Ending Time - When dust, dirt, sand, or debris was last seen in the whirlwind.
 Direct Fatalities/Injuries
 People who were asphyxiated due to high dust/sand content in the air. (Rare)
 People who were hit by flying debris.
 Vehicle was tipped over or blown off a road.
 Indirect Fatalities/Injuries
 Vehicular accidents caused by reduced visibility during a dust devil, or vehicular accidents caused by debris left on a road after a dust devil passed by.

#### Example:

#### **Maricopa County**

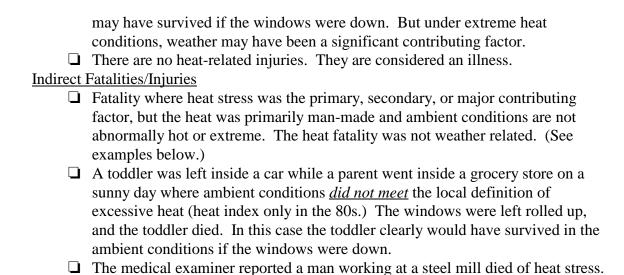

A sunny, hot day caused many dust devils to form. One became quite strong and moved directly along Interstate 8, according to amateur radio reports. Visibility was severely reduced in the dust devil. One motorist drove into the dust devil, which pushed and flipped the vehicle off the road. The driver and one passenger were injured. Winds were estimated at 56 knots (65 mph).

7. **Dust Storm (Z).** Strong winds over dry ground, with little or no vegetation, that lifts particles of dust or sand, reducing visibility below regionally established values (usually 1/4 mile or less), and results in a fatality, injury, significant damage, or significant disruption of transportation.

<u>Beginning Time</u> - When an area of blowing dust or sand first reduced visibility to regionally established values or dust storm began to cause significant impact. <u>Ending Time</u> - When an area of blowing dust or sand diminished so that visibility was above regionally established values or dust storm no longer had significant impact.

<ul> <li>Direct Fatalities/Injuries</li> <li>□ People who were asphyxiated due to high dust/sand content in the air. (Rare)</li> <li>□ People who were hit by flying debris.</li> <li>□ Vehicle tipped/pushed over or blown off a road by the strong winds, resulting in an accident and associated fatalities/injuries.</li> <li>Indirect Fatalities/Injuries</li> <li>□ Vehicular accidents caused by reduced visibility during a dust storm, or vehicular accidents caused by debris left on a road after a dust storm has passed</li> </ul>

MIZ068>070-075- Livingston - Oakland - Macomb - Washtenaw - Wayne - Lenawee - 076-082-083 Monroe

The outside temperature was only 80 degrees.

02 1300EST 4 Excessive Heat 05 2000EST

Very hot and humid weather moved into southeast Michigan just in time for the Fourth of July weekend. High temperatures were in the middle to upper 90s across metro Detroit all 4 days, with Detroit City Airport reaching 100 degrees on July 4. The high of 97 degrees at Detroit Metropolitan Airport on July 5 set a new record for that date. Heat indices were in the 105- to 115-degree range all four afternoons. Dozens of people were treated at area hospitals for heat-related illnesses over the weekend, and four elderly people died from heat stroke based on medical reports. Two of the fatalities occurred on July 4, one on July 5, and one person died on July 7 after being hospitalized for heat stroke for 2 days. The heat wave finally broke when a cold front moved through lower Michigan late in the day on July 5. M89PH, F77PH, M95PH, F72PH

#### MOZ037 Jackson

The high temperature reached 92 degrees with a heat index of 99 on the afternoon of June 11. The medical examiner reported an elderly woman died from heat stress. She was found dead in her apartment. F84PH

9. **Extreme Cold/Wind Chill (Z).** Period of extremely low temperatures or wind chill equivalent temperatures (significantly below normal), that causes significant human and/or economic impact. Normally, temperatures/wind chills should meet locally established values for

extreme cold or wind chill to be entered as a *Storm Data* event. However, if fatalities occur with abnormally cold temperatures/wind chills but extreme cold/wind chill criteria are not met, the event should also be included in *Storm Data* as an Extreme Cold/Wind Chill event and the fatalities are direct.

<u>Beginning Time</u> - When extreme or abnormally cold temperatures or wind chill equivalent temperatures began.

<u>Ending Time</u> - When extreme or abnormally cold temperatures or wind chill equivalent temperatures ended.

#### **Direct Fatalities/Injuries**

- A fatality where hypothermia was ruled as the primary, secondary, or major contributing factor as determined by a medical examiner or coroner. If other weather factors, such as freezing/frozen precipitation, disorient the person, trap the person, or cause the person to collapse, but cause of fatality was exposure or hypothermia, the fatality may be entered under the event type Winter Storm, Winter Weather/Mix, etc. The *Storm Data* preparer must use sound judgment and work with the local medical examiner or coroner.
- ☐ Elderly person wandered away from a nursing home, became disoriented, and froze. Medical examiner ruled that the major cause of death was hypothermia.
- ☐ Medically treated frostbite or hypothermia can be considered an injury.

#### **Indirect Fatalities/Injuries**

After shoveling snow, a man collapsed in the driveway. The medical examiner determined the primary cause of fatality was heart attack.

#### Examples:

# WYZ054>058 Gillette - South Campbell - Moorcroft - Wyoming Black Hills - Weston 01 1200MST 4 0 500K 50K Extreme Cold/Wind Chill 03 1000MST

Bitter cold arctic air settled over parts of northeast Wyoming. Temperatures fell to 35 below to 45 below zero (-45 in Gillette) on the 2nd. Four fisherman were found frozen at their campsite near Pine Haven at Keyhole State Park in Crook County. The medical examiner classified the fatalities to cold-hypothermia. The extreme cold caused water mains and pipes to freeze and burst in Gillette and Newcastle, resulting in water damage to homes and businesses. In addition, a couple of ranchers reported losses. M44OU, F42OU, F57OU, M59OU

#### NDZ050 Mcintosh

15 1000CST 1 0 Extreme Cold/Wind Chill 15 2200CST

An 84-year-old Lehr man died of exposure when he went to visit the grave of his wife. The man was found 1 mile from his house. Temperatures that day were around 20 below and wind speeds of 17 to 22 knots (20-25 mph). Wind chills

were estimated to be around 60 below. The man was not wearing a coat or gloves when he was found. M84OU

#### INZ001 Lake

11 2000CST 1 0 Extreme Cold/Wind Chill 12 1400CST

A homeless man was found dead in Gary, Indiana. The cause of death was exposure. It was raining on this cold October day with winds of 17 to 26 knots (20 to 30 mph) and temperatures in the 30s. M42OU

10. **Flash Flood (C).** A flood caused by heavy rainfall, a dam break, or ice jam, occurring within 6 hours of the causative event, and poses a threat to life or property. The *Storm Data* preparer must use good judgment in determining when the event is no longer characteristic of a flash flood and becomes a flood. Flash floods do not exist for two or three consecutive days.

<u>Beginning Time</u> - When flood waters begin to threaten life or property. In some cases, a flash flood may begin when water left the banks of a river; in others it may be when the water level was 2 to 3 feet above bank-full. It may also be when raging currents of water only 1-foot deep on urban streets sweep people off their feet, resulting in a fatality/injury. Professional judgment is needed by the *Storm Data* preparer.

It is possible for a flash flood event to occur during a flood event due to intense rainfall in a short period of time. The beginning time of the flash flood event should correspond to the rapid rise in water levels following the causative event (6 hours or less).

<u>Ending Time</u> - When flood waters receded to a point where there was no longer any threat to life or property. Keep in mind that flash flooding may continue to threaten life or property many hours after the rain ends.

#### Direct Fatalities/Injuries

A person drowned in a flash flood or struck by an object in flash flood waters.
A motorist drowned in an overturned car after driving around a barricade down
a hill onto a flooded stretch of highway that has flood waters 4 feet deep
(doesn't matter how irresponsible the driver was).
A group of people having a party in an apartment located in a flood plain drown
when flood waters trapped them.
Several campers drowned when a thunderstorm 10 miles away in an adjacent
county/parish sent a flash flood wave down an arroyo where they camped.
Debris or missiles caught in flood waters struck and injured a person walking
along a flooding river.
A child playing near a stream or storm sewer was swept away by flood waters
and drowned
Drowning due to collapse of a levee or retaining wall from flood waters.

T 1' . TO . 1'.' /T 1'	. •	
Indirect Fatalities/Indirect	t In	111r1ec
maneet i atanties/manee	<i>ι</i> 111	Jurios

- ☐ Vehicular accidents and incidents that the flash flood contributed to but did not directly cause.
- ☐ Children playing in debris or workers cleaning up debris left by flood. Debris shifted and child or worker was struck, pinned, or crushed by debris.
- A flash flood loosened rocks on a mountainside. After the water receded, a rock climber fell to his death after grabbing onto one of the loosened rocks for a handhold.
- A remote mountain pass road was undermined in a flash flood by a nearby creek. After the water receded, a vehicle drove into the hole in the road, killing the passenger and injuring the driver.

#### **Milwaukee County**

Wauwatosa to 06 1000CST 2 0 2.5M Flash Flood Milwaukee 07 1600CST

Tropical-like thunderstorms dumped rainfall amounts of 8 to 12 inches between 1200 and 1900 CST on July 6 in a 7-mile-wide band from the city of Waukesha (Waukesha Co.) east to downtown Milwaukee (Milwaukee Co.). Flash flooding killed two people who drowned when their car was swept away by flood waters at the intersection of I-94 and I-43. Widespread flood damage occurred to 2000 homes and 500 businesses. The maximum rainfall total in Milwaukee County was 11.25 inches which was measured at the downtown Public Safety Building. The Menomonee River in Wauwatosa (Milwaukee Co.) quickly crested at 19.5 feet at 2200 CST on the 6th, or 8.5 feet above flood stage. This is a new record crest and about a 150-year flood. M25IW, F24IW

#### Waukesha County

Waukesha to 06 1000CST 4 10 2.0M Flash Flood Elm Grove 07 1600CST

Tropical-like thunderstorms dumped rainfall amounts of 8 to 12 inches between 1200 and 1900 CST on July 6 in a 7-mile-wide band from the city of Waukesha (Waukesha Co.) east to downtown Milwaukee (Milwaukee Co.). Widespread flood damage occurred to 500 homes and 150 businesses from the city of Waukesha east through Brookfield and Elm Grove. Four people in a vehicle drowned when flash flood waters up to 5 feet deep flipped their car over at the intersection of I-94 and Moorland Road. Ten people were injured in the city of Waukesha by tree debris in Fox River. A coop observer in the southern part of Brookfield (Waukesha Co.) measured 11.98 inches of rain between 1100 and 1900 CST on the 6th. M48IW, F46IW, M14IW, F15IW

#### **Herkimer County**

Dolgeville 28 0930EST 0 0 4K Flash Flood 1500EST

An ice jam developed during the morning of February 28 along East Canada Creek at the State Highway 29 bridge in the village of Dolgeville. The water rapidly backed up, flooding the cellars of nearby buildings. The ice jam broke up in the late afternoon without any further flooding downstream.

#### **Cannon County**

Woodbury 07 0830CST 0 0 100K Flash Flood 1300CST

A dam broke and the resultant flash flood damaged a dozen homes downstream.\* (\* This example would apply to levees, retaining walls, and other structures.)

10.1 Examples of a Flash Flood that Evolved into a Flood.

#### **Kern County**

Frazier 10 1900PST 0 0 1.0M Flash Flood Park 11 0100PST

A powerful storm dropped 3 to 4 inches of rain over portions of Kern County during the afternoon of the 10th. The heavy rains caused flash flooding on several creeks. Frazier Mountain Road between I-5 and Shallock Road and Highway 66 near Maricopa were all washed out by overflowing creeks.

#### **CAZ095** Kern County Mountains

11 0100PST 0 0 Flood

11 1000PST

A powerful storm dropped 3 to 4 inches of rain over portions of Kern County during the afternoon of the 10th. The heavy rains caused flash flooding on several creeks. Frazier Mountain Road between I-5 and Shallock Road and Highway 66 near Maricopa were all washed out by overflowing creeks. Additional 1 to 2 inches of rain caused creeks to stay in flood and roads to remain closed through the night. Flood waters subsided by late morning on the 11th.

11. **Flood (Z).** The inundation of a normally dry area caused by an increased water level in an established watercourse, or ponding of water, occurring more than 6 hours after the causative event, and posing a threat to life or property.

<u>Beginning Time</u> - When flood waters began to threaten life or property. In some cases, a flood may have been when water left the banks of a river, in others it may not have been until the water level was two 2 to 3 feet above bank-full. Professional judgment is needed by the *Storm Data* preparer.

Ending Time - When flood waters receded to a point where there was no longer any threat to life or property. Keep in mind that flooding may continue to threaten life or property many days after the rain ends. Direct Fatalities/Injuries ☐ A fatality as a result of drowning in a flood or being struck by an object in flood A person walked around a barricade into 3-foot deep flood waters near a river. The current swept him off his feet and he drowned. Two people rafting down a flooded street hanging on to inner tubes. Water turbulence flips them over, hitting their heads on a curb, and both drown. Debris or missiles caught in flood waters struck and injured a person walking along a flooded river. Indirect Fatalities/Injuries ☐ Vehicular accidents the flood contributed to but did not directly cause. Example: **RIZ001 Northwest Providence** 17 0200EST 0 2 3.5M 5.7M Flood

Widespread low-land flooding occurred in northwest Providence County, resulting in considerable flood damage to 1500 homes, 400 businesses, and 200 agricultural farms. Two men near South Foster were injured by floating debris in the Ponaganset River when they rescued a dog. The flood was initiated by rainfall amounts of 4 to 5 inches (on top of wet ground) that fell between 1800 CST on the 16th and 1800 CST on the 17th.

12. **Frost/Freeze (Z).** Surface air temperature of 32° Fahrenheit (F) or lower, or the formation of ice crystals on the ground or other surfaces, over a widespread area, for a climatologically significant period of time, causing significant human/economic impact.

<u>Beginning Time</u> - When temperature first fell below freezing or frost began to form. <u>Ending Time</u> - When temperature rose above freezing or when frost melted. Direct Fatalities/Injuries

□ None. This *Storm Data* event type applies to agricultural losses. Any fatality in which the medical examiner determined that the primary cause was hypothermia should be entered under the event type Extreme Cold/Wind Chill.

#### Indirect Fatalities/Injuries

18 1500EST

Any traffic casualties due to ice formation on roads or bridges and any pedestrian casualties due to icy walkways.

FLZ039-042 Levy - Citrus - Hernando

-048 18 0500EST 0 0 50K Frost/Freeze

18 0800EST

Freezing temperatures between 30 and 32 degrees occurred. The average duration was around 1 hour with up to 3 hours in isolated locations. Some crop damage was noted in Levy County.

GAZ028-029 Hart - Elbert

06 0500EST 0 0 Frost/Freeze

06 0800EST

Near record low temperatures in the lower to middle 30s with clear skies and light winds resulted in widespread frost. No crop damage was reported but frost formation on roads and bridges resulted in several traffic accidents, including one fatality (indirect fatality) on Highway 72 at the Broad River bridge.

13. **Funnel Cloud (C).** A rotating visible extension of a cloud pendant to a convective cloud with circulation not reaching the ground. The funnel cloud should be large, noteworthy, or create strong public interest to be entered.

Beginning Time - When the funnel cloud was first observed.

Ending Time - When the funnel cloud was no longer visible.

**Direct Fatalities/Injuries** 

A fatality or injury directly caused by the circulating winds of a funnel cloud. Note that by definition, a funnel cloud fatality can't occur on the ground, so fatalities or injuries can only be associated with aviation mishaps. (Rare)

Indirect Fatalities/Injuries

☐ All fatalities/injuries that resulted from distress brought on by the sight of the funnel cloud, or any telecommunication to those individuals of the possibility of funnel clouds.

#### Examples:

#### **Tolland County**

Gilead 10 1800EST 0 0 Funnel Cloud

1805EST

A funnel cloud was observed by local law enforcement officials and Amateur Radio operators. It extended about half way from the cloud base to the ground as it passed over town.

**Power County** 

13 E American 30 1300MST 0 1 150K Funnel Cloud

Falls 1302MST

A small airplane flew into a funnel cloud west of Pocatello; and based on reports from highway motorists, the pilot lost control. The pilot crash-landed at

the Pocatello Municipal Airport, and was injured. The plane was a total loss based on the insurance claim.

14. **Hail (C).** Frozen precipitation in the form of balls or irregular lumps of ice. Hail 3/4 inch or larger in diameter will be entered. Hail accumulations of smaller size which causes significant property and/or crop damage, or casualties, should be entered. Maximum hail size will be encoded for all hail reports entered.

Beginning Time - When hail first occurred.

Ending Time - When hail ended.

<u>Note</u>: When a series of hail reports occur within 10 miles or 15 minutes of each other, within a county/parish, from the same storm or storm complex, the beginning time can be the time of the first report and the ending time can be the time of the last report.

# Direct Fatalities/Injuries □ Baseball-size hail struck a person in the head, causing a fatality/injury. □ A fatality/injury directly caused by wind driven hail where both the hail size and winds were below severe criteria. This would be an extremely rare event. □ Hail falls with sufficient intensity to restrict visibility causing a driver to lose control of a vehicle. The vehicle rolls over or hits an object, resulting in a fatality/injury. Indirect Fatalities/Injuries □ Hail covered the road. A vehicle lost control on the slippery road and crashed

#### Examples:

#### **Medina County**

Brunswick

20 1730EST 1 3 1.3M 50K Hail (4.00) 1735EST

into a tree, killing or injuring the driver.

A prolific hailstorm sat over Brunswick, Ohio, for 5 minutes, resulting in a fatality, injuries, and considerable property damage. A 10-year old boy died on a ball field due to head injuries sustained in a barrage of 4-inch diameter hail. Three other boys suffered head injuries. The large hail damaged at least 500 vehicles, and 700 homes reported broken windows or awnings. The ground was covered white, and the hail didn't melt until the following afternoon. M10BF

# **King County**

Guthrie 02 2240CST 2245CST

0 0 500K Hail (0.50)

Hail up to ½ inch in diameter accumulated to several inches. The hail completely flattened and shredded young corn crops at several farms near Guthrie. Insurance company officials declared the corn crop a total loss.

15. **Heavy Rain (C).** Unusual heavy fall of rain which does not cause a flash flood, or flood, but causes locally significant damage, e.g., roof collapse or other human/economic impact. Beginning Time - When heavy rain that lead to damage began. Ending Time - When heavy rain diminished to the degree that it no longer posed a threat to life or property. Direct Fatalities/Injuries A fatality or injury caused by debris from a structural collapse resulting from water loading. <u>Indirect Fatalities/Injuries</u> All fatalities/injuries that resulted from vehicle accidents due to hydroplaning, or from sliding on slippery road surfaces, or from poor visibility. Example: **Minnehaha County** Sioux Falls 03 1100CST 7 300K Heavy Rain 1200CST A short-lived but intense thunderstorm dumped 2 inches of rain between 1100 and 1130 CST, resulting in the collapse of a roof of an old school building at noon. Two students were crushed by roof debris, and 7 others were injured. Apparently, the rain came down so hard that water loading on the roof lead to the roof collapse. Minor street flooding occurred elsewhere in Sioux Falls, but in general the city's drainage system was up to the task. M8SC, M9SC **Heavy Snow (Z).** Snowfall equal to or exceeding regionally established values (such 16. as 4, 6, or 8 inches or more in 12 hours or less; or 6, or 8, or 10 inches in 24 hours or less). In some heavy snow events, structural damage, due to the excessive weight of snow accumulations, may occur in the few days following the meteorological end of the event. The preparer should include this damage as part of the original event and give details in the narrative. Beginning Time - When regionally established heavy snow values were first reached. The beginning time of the snow storm should be included in the narrative. Ending Time - When snow accumulation ended. Direct Fatalities/Injuries A fatality/injury from a mass of snow sliding off a roof or falling through a A tree toppled from heavy snow and landed on someone, killing him. ☐ A person walking through deep snow, fell down, and died of exposure. Indirect Fatalities/Injuries ☐ Any fatality from a vehicle accident related to deep snow on the roads or

Any vehicle accident involved with a snow plow.Any fatality related to shoveling or moving snow.

slippery roads.

## IAZ013-014 Fayette - Clayton

25 1400CST 0 0 Heavy Snow

25 1800CST

Snow began at 1000 CST and reached 6 inches at 1400 CST and tapered off to flurries by 1800 CST. A total of 6 to 8 inches of snow fell from Oelwein to Strawberry Point.

#### VTZ013-014 Bennington - Windham

11 2200EST 1 0 Heavy Snow

12 1800EST

Record-breaking heavy snow pounded the southern part of Vermont. Accumulations of 30 to 40 inches paralyzed the region. Travel and commerce came to halt, and there were numerous reports of downed power lines and structural damage due to the weight of snow on roofs. Some roofs of businesses collapsed during the 2 days following the end of the heavy snow since clean-up crews were unable to reach those buildings. One person died from exposure after he left his snow-covered vehicle and attempted to walk to a nearby residence during the height of the storm. Accumulating snow and lower visibilities began at 1500 EST on the 11<sup>th</sup>, and reached 6 inches at 2200 EST. Thereafter, accumulation rates increased to 2 to 3 inches per hour through the overnight and morning hours. M70OU

17. **Heavy/High Surf (Z).** Large waves breaking on or near shore, usually resulting from swell spawned by a distant storm, causing a fatality, injury or damage. In addition, if accompanied by anomalous high tides, heavy/high surf may produce beach erosion and possible damage to beachfront structures. Heavy surf conditions may be accompanied by rip currents and shore breaks.

<u>Beginning Time</u> - When near-shore wave heights met locally developed criteria (usually 7 to 10 feet).

<u>Ending Time</u> - When near-shore waves subsided below locally developed criteria. Direct Fatalities/Injuries

- ☐ A surfer ventured out into severe wave conditions and was injured or drowned.
- ☐ A man fishing off a pier was swept into the sea.
- ☐ A boat traversing an ocean inlet foundered on the rocks and the boaters drowned.

#### Indirect Fatalities/Injuries

A swimmer, struggling to get out of the heavy surf, suffered a heart attack.

#### MNZ088-095 Fillmore - Winona

30 0100CST 0 0 2.5K High Wind (G56) 0900CST

Winds gusting to an estimated 56 knots (65 mph) for about 8 hours blew down numerous trees and toppled dozens of signs in Spring Valley and Lewiston. A young girl in Spring Valley was killed when she touched a downed power line (indirect fatality). The high winds were generated by a deep low pressure moving northeast through the Minnesota Arrowhead region.

Strong Wind (S39)<sup>M</sup>

Sustained west winds reached 39 knots (40 to 45 mph) for several hours across northwest South Dakota behind a fast-moving cold front. Uncharacteristically, there were no gusts of 50 knots (58 mph) or higher.

19. **Hurricane/Typhoon (Z).** A tropical cyclone in the Atlantic or northeast Pacific Ocean east of the International Date Line (hurricane), or in the north Pacific Ocean west of the International Dateline (typhoon), with 1-minute sustained wind speeds equal to or greater than 64 knots (74 mph). The hurricane/typhoon should be included as an entry when its effects, such as wind, storm surge, freshwater flooding, and tornadoes are experienced in the WFO's county warning and forecast area (CWFA), including the coastal waters. The eye/center of the hurricane/typhoon may not actually move ashore and hurricane-force winds may not be observed in the CWFA.

The hurricane/typhoon will usually include many individual hazards, such as storm surge, freshwater flooding, tornadoes, rip currents, etc. Refer to Section 3.6 for detailed information on how and what to encode with regards to the hurricane/typhoon event, as well as its associated individual hazards.

<u>Beginning Time</u> - When the direct effects of the hurricane/typhoon were first experienced.

<u>Ending Time</u> - When the direct effects of the hurricane/typhoon were no longer experienced.

#### Direct Fatalities/Injuries

DIICCLI	atarities/ injuries
	Casualties caused by storm surge, rough surf, freshwater flooding, or wind-
	driven debris or structural collapse.
	The wind caused a house to collapse or blew a tree onto someone.
	A person drowned while surfing in rough waters.
	The storm surge drowned people in a beach house.
	Someone drowned when flood-waters swept a vehicle into a river.
Indirect 1	Fatalities/Injuries
	Someone suffered a heart attack while removing debris.

Someone was electrocuted by touching downed power lines.
Someone drowned when a vehicle was driven into a canal.
Someone was killed in a vehicle accident caused by a hurricane-related missing
traffic signal.

FLZ018-021 >023

Broward - Collier - Dade - Monroe 24 0325EST 2 25 10B 250M Hurricane/Typhoon 0900EST

The eye of Hurricane Andrew moved ashore in south Dade County near Homestead with a minimum central pressure of 922 mb and maximum storm surge of 16.9 feet. Maximum sustained winds were estimated at 126 knots (145 mph) with gusts to at least 152 knots (175 mph). Andrew was a Category 4 storm and was the third strongest in U.S. history. In Broward, Collier, Dade, and Monroe Counties, the winds killed 2 people (trees falling on moving vehicles). All of the associated effects of Andrew in southeast Florida resulted in 15 fatalities, 250 injuries, \$25.0B in property damage, and around \$1.0B in crop damage. Specifically in southeast Florida, Andrew's inland flood waters resulted in 5 fatalities, 100 injuries, \$15B in property damage, and \$250M in crop damage. The eight associated tornadoes resulted in 2 fatalities, 25 injuries, and \$1B in property damage. The powerful winds resulted in 4 fatalities, 50 injuries, \$13B in property damage, and \$750M in crop damage. The storm surge along the coast resulted in 4 fatalities, 75 injuries, \$6M in property damage. Besides the 15 direct fatalities, at least 26 indirect fatalities occurred, during clean-up activities. M35VE, F56VE

Typhoon Paka formed in the central Pacific southwest of the Hawaiian Islands on November 28 and tracked westward crossing the International Dateline around 1200 SST December 7. Paka entered the Marshall Islands as a tropical storm on December 10 became a typhoon on December 11 and crossed through the Marshall Islands until December 14, damaging structures and crops. Paka became a super typhoon on December 15 and passed 5 miles north of Guam. The lowest pressure observed on Guam was 948 mb and the highest wind was measured at 100 knots (115 mph) with a gust to 152 knots (175 mph). On Guam, the typhoon winds resulted in 1 injury (debris hit a person on the head), and damaged numerous businesses and homes. Similar damage was noted on Rota. Collectively, all of the effects of Typhoon Paka resulted in no fatalities, 2 people injured, and over \$504M in property damage. Specifically, Paka's flood

waters resulted in 1 injury, and \$200M in property damage; and associated powerful winds resulted in 1 injury, and over \$254M in property damage. The storm surge along the coast resulted in \$50M in property damage.

#### PZZ655 Inner Waters from Pt. Mugu to San Mateo Pt CA

05 0900PST 2 2 Rip Current 1600PST

A 25-year-old male and a 24-year-old female drowned in a rip current near a pier at Huntington Beach. Lifeguards made over two dozen rescues with two near-drownings as 10-foot swells from Hurricane Angelo swept north. M25IW, F24IW

26. **Seiche (Z).** A standing wave oscillation in any enclosed lake which continues after a forcing mechanism has ceased and results in shoreline flooding. In the Great Lakes and large inland lakes, large pressure differences, high winds, or fast-moving squall lines may act as the forcing mechanism. In addition, earthquakes or landslides can initiate a seiche. When the forcing mechanism ends, the water sloshes back and forth from one end of the lake to the other, causing water level fluctuations of up to several feet before damping out.

Beginning Time - When water began to rise or fall.

Ending Time - When water returned to pre-seiche levels.

#### Direct Fatalities/Injuries

- Persons near shore were swept away by the large wave and drowned.
- ☐ A boat was overturned by the large wave, drowning those on board.
- A structure was damaged or flooded by the wave killing those inside.

#### Indirect Fatalities/Injuries

- Person died when cleaning up seiche-generated debris after the seiche ended.
- ☐ Person died from a building that collapsed from beach erosion after a seiche ended.

#### Example:

#### MIZ071 Van Buren

28 0300EST 0 0 250K Seiche 0315EST

An early morning seiche of 3 feet accompanied an impressive thunderstorm squall line which crossed Lake Michigan into western Lower Michigan. The rising water damaged boats and docks at South Haven. At least \$250,000 in damage occurred along the shoreline.

Gusty winds to 45 knots (52 mph) occurred in the Rio Grande Valley of Deep South Texas behind a passing cold front. Power lines and store signs were downed in Rio Grande City, Mercedes, and Brownsville. A large store sign fell on a passing car on US 281 in Brownsville, killing the driver. M27VE

30. **Thunderstorm Wind (C).** Winds, arising from convection (with or without lightning), with speeds of at least 50 knots (58 mph), or winds of any speed producing a fatality, injury, or damage. A maximum wind speed in knots (measured or estimated) will be entered. Downbursts (including dry or wet microbursts) and gustnadoes will be reported as Thunderstorm Wind events.

<u>Beginning Time</u> - When damage first occurred or winds 50 knots (58 mph) or greater were first reported.

Ending Time - When damage ended or winds of 50 knots (58 mph) were last reported.

<u>Note</u>: When a series of severe wind reports or damage reports occur within 10 miles or 15 minutes of each other, within a county/parish from the same storm or storm complex, the beginning time can be the time of the first report and the ending time can be the time of the last report.

Direct Fa	atalities/Injuries
	A thunderstorm wind gust snapped a large tree limb. The limb fell on a passing
	car, killing or injuring the driver.
<u>Indirect</u>	Fatalities/Injuries
	A wind gust snapped a large tree limb which fell on the road. A few minutes
	later a car drove into the tree limb and the driver was killed or injured.
	A wind gust downed numerous trees and limbs. The next morning a person
	cleaning up the debris in his yard died or is injured from a chainsaw accident.
	A thunderstorm gust toppled a tree on a home's gas meter which exploded. The
	resultant fire killed two people who were in the home.

#### **Examples**:

#### **El Paso County**

Colorado Spgs 23 1730MST 0 0 0 Thunderstorm Wind  $(G70)^{M}$ 

A small, dry-microburst struck the 5100 block of North Nevada Avenue in Colorado Springs. The downburst winds tore down power lines (but left the poles standing), ripped 40 square feet of roofing off a building, blew a pontoon boat 30 feet off its trailer, damaged billboards, and brought down tree limbs 6 to 8 inches in diameter.

#### **DeKalb County**

Malta 12 1505CST

Thunderstorm winds downed numerous large trees, ripped off several barn roofs, and blew over a fuel storage tank. Two people were injured (indirectly related) when their vehicle struck a large tree on a road about 1 hour after the storm ended.

15K

10K

#### **Langlade County**

**Antigo** 

10 1309CST

0

Thunderstorm Wind (G45)<sup>M</sup>

**Thunderstorm Wind (G65)** 

A wind gust from a thunderstorm blew a home-built aircraft onto its side, resulting in damage to the airplane.

#### Waukesha County

Genesee

15 1915CST

0 50K

**Thunderstorm Wind (G50)** 

A gustnado along the leading edge of a downburst damaged a barn and farm house along Highway 59 near Genesee. Interaction between the downburst and outflow from another thunderstorm just south of the city of Waukesha generated the gustnado.

31. **Tornado (C).** A violently rotating column of air, pendant to a convective cloud, with circulation reaching the ground. The tornado path length in miles and tenths, width in yards, and Fujita-scale will be entered. The tornado path length excludes sections without surface damage, unless other evidence of the touchdown (e.g., a trained spotter report, videotape of the tornado over a plowed field, etc.) is available. The excluded section will not exceed 2 continuous miles or 4 consecutive minutes of travel time; otherwise, the path will be categorized as consisting of separate tornado events. Path width in the entry header is the <u>maximum</u> width over the entire path, or of each segment in a multi-segment tornado. It is desirable to include the <u>average</u> path width in the narrative, especially for significant tornadoes. When discernable, wind damage from the rear flank downdraft should not be considered part of the tornado path but should be entered as a Thunderstorm Wind event. Gustnadoes will be reported as Thunderstorm Wind events. Landspouts and cold-air funnels, meeting the objective tornado criteria listed in Section 3.7.2, will be classified as Tornado events.

A vortex that moves over both water and land will be characterized as a waterspout for that portion of its path over the waters and bays of the ocean, Great Lakes, Lake Okeechobee, or Lake Pontchartrain (those assigned Marine Forecast Zones), and a tornado for that portion of its path over land or inland bodies of water that are not assigned Marine Forecast Zones.

Beginning Time - When the tornado first contacted the ground.

Ending Time - When the tornado lost contact with the ground.

Direct Fatalities/Injuries

☐ Structures or trees were blown over and landed on someone, resulting in a fatality/injury.

	People became airborne and struck the ground or objects, resulting in a
	fatality/injury.
	High voltage power lines were blown onto a car, killing or injuring those inside
	A high-profile vehicle was blown over, resulting in a fatality/injury.
	A vehicle was blown into a structure or oncoming traffic, resulting in a
	fatality/injury.
	Objects became airborne (debris, missiles), resulting in a fatality/injury.
	A boat on an inland lake or river was blown over or capsized, resulting in a
	drowning.
<u>Indirect</u>	Fatalities/Injuries
	A person was killed or injured after running into a tree downed by the tornado.
	Someone was electrocuted by touching downed power lines.
	Someone suffered a heart attack and died as a result of removing debris.

- 31.1 <u>Single-Segment (Non Border-crossing) Tornado Entries.</u>
- 31.1.1 Example of a Tornado Within One County/Parish.

#### **Page County**

Bingham to 2 NE Norwich

22 1905CST 6 75 0 0 5K 5K Tornado (F1) 1917CST

At 1905 CST, a tornado touched down near Bingham, and moved east to Norwich before lifting off the ground 2 miles northeast of Norwich. Two homes in Bingham and one in Norwich sustained minor damage. The tornado track was not continuous; there were two areas (both about one-half-mile long) east of Bingham where damage was not discernable. Average path width was 30 yards.

31.1.2 Example of a Tornado that Changed Direction Within One County/Parish. A tornado that affects only one county/parish should be entered as only one segment, even if the tornado changed direction within a county/parish. The end points should be entered in the heading and the complete description of the tornado's path, including any variation from a straight line, should be described in the narrative.

#### **Jackson County**

5 W Vernon to 14 2308CST 10 150 0 0 150K Tornado (F1) 5 NNE Vernon 2326CST

A tornado touched down 5 miles west of Vernon. The tornado moved east through the city of Vernon, and then veered left at the center of the city. It finally dissipated about 5 miles north-northeast of town. Trees and power lines were blown down and several barns were damaged. A business and a home were partially unroofed in Vernon. Based on damage, the tornado winds were around 83 knots (95 mph). Average path width was 75 yards.

31.1.3 Example of a Tornado over an Inland Body of Water (Without an Assigned Marine Forecast Zone).

#### **Davis County**

7SW Layton 01 1738MST 1 30 0 0 Tornado (F0) 1741MST

State Police spotted a tornado over Great Salt Lake. It dissipated before reaching shore.

31.1.4 Examples of a Tornado that Became a Waterspout (Body of Water with Assigned Marine Forecast Zone).

#### St. Louis County

2E Arnold to 28 1651CST 4.4 60 0 0 Tornado (F1)
French River 1655CST

A tornado touched down 2 miles east of Arnold. A barn and an outbuilding were destroyed and trees were damaged. The tornado traveled until it reached the shore of Lake Superior near French River where it continued as a waterspout.

#### **LSZ144**

Two Harbors to 28 1655CST 0 0 Waterspout
Duluth MN 1657CST

The St. Louis County tornado event reached the shores of Lake Superior. This waterspout lasted another 2 minutes before dissipating.

31.1.5 Examples of a Waterspout (Body of Water with Assigned Marine Forecast Zone) that Became a Tornado.

#### **LMZ645**

5NE Wind Pt  $\phantom{0}$  15 1700CST  $\phantom{0}$  0 1 100K Waterspout to Wind Pt WI 1705CST

A waterspout developed northeast of Wind Point and moved slowly southwest. Three sail boats about 2 miles offshore were destroyed and one person was injured. The waterspout moved onshore at Wind Point and continued as a tornado in Racine County.

#### **Racine County**

Wind Pt to 15 1705CST 0 0 200K Tornado (F1) 3SW Wind Pt 1707CST

A waterspout moved onshore as a tornado at Wind Point. The vortex weakened but still managed to cause significant damage to two piers, a yacht club building, and two small boats. Estimated wind speeds of the tornado were about 65 knots (75 mph).

#### 31.2 <u>Segmented and Border-crossing Tornado Entries</u>.

31.2.1 Examples of a County/Parish Line-crossing Tornado Within a CWFA. Tornadoes that cross county/parish lines must be entered as segments with one segment per county/parish. *Storm Data* preparers must coordinate entries for tornadoes that cross state lines or CWFAs. Consistency between *Storm Data* entries of border crossing tornadoes is needed to assure an accurate tornado path. Otherwise a single tornado may be misinterpreted as being two separate tornadoes. This can easily occur when external customers, not familiar with *Storm Data* practices, use the National Climatic Data Center's (NCDC) Web site query feature. It is critical that all counties/parishes affected by a single tornado, and the exact location that a tornado exits or enters a county/parish, be mentioned in the narrative that discusses that tornado. Do not segment a tornado within a county/parish (an entry for each portion of a tornado that appreciably changes directions). In the example below, the first line of the narrative makes it clear that the tornado moved across a county/parish line, and indicates exactly where the tornado exited the first county/parish.

Coal County
4 SE Coalgate
2.5 ENE Cairo

11 0425CST 8 200 1 1 75K Tornado (F2) 0434CST

This tornado formed 4 miles southeast of Coalgate and tracked northeastward for 8 miles before exiting Coal County about 2.5 miles east-northeast of Cairo at 0434 CST. The tornado continued in Atoka County for another 5 miles, before dissipating at 0440 CST. In Coal County, 1 fatality and injuries to another person occurred when a mobile home was thrown approximately 200 yards and disintegrated 4 miles east of Coalgate. In addition, a well-constructed frame home suffered severe roof damage and exterior wall damage in extreme eastern Coal County. While in Coal County it was rated as F2, but in Atoka County it was rated as F0. Average path width in Coal County was 100 yards, while the maximum width was 200 yards.

Atoka County
1.5 NW Wardville
to 5.5 SE Wardville

11 0434CST 5 100 0 0 6K Tornado (F0) 0440CST

This tornado formed 4 miles southeast of Coalgate in Coal County and entered Atoka County about 1.5 miles northwest of Wardville at 0434 CST. The tornado then continued for another 5 miles before dissipating 5.5 miles southeast of Wardville at 0440 CST. In Atoka County, minor roof damage was inflicted on a mobile home, and numerous trees were damaged. While in Coal County, it was rated as F2, but in Atoka County it was rated as F0. Average path width in Coal County was 50 yards.

31.2.2 <u>Examples of a County/Parish Line-crossing Tornado With Other Embedded Severe Events</u>. Referring to the example below, keep in mind that when entering several individual events into *Storm Data* for a specific episode, if a tornado crosses a county/parish line (multi-

segmented) and there are several other events (i.e., hail, thunderstorm winds, etc.) falling between the beginning time of the first segment and the beginning times of subsequent segments of the tornado, these events will be inserted between the tornado segments, breaking up the tornado. The best way to convey a tornado is a county/parish line crossing, segmented tornado is to combine all segments of the tornado into its own episode. Then clear the screen and enter the remaining events, including those that fell in between the segments of the tornado, as a separate episode. Therefore, when people use the *Storm Data* publication, they will see a nice orderly list of events with no breakup of a multi-segmented tornado (in the CWFA), thus making it easier to find the information that they need (see example below). This is what the episode feature was developed for—to create a more orderly list of events. A separate narrative will be composed for each tornado. This will minimize the possibility that tornado information is lost in a large narrative. Simply writing a two or three sentence narrative, even for a brief tornado touchdown, will get the information across about that tornado.

#### **Calhoun County**

A tornado spun up in the western part of Calhoun County in the village of Shepherd and tracked northeast, crossing into Pontotoc County 5 miles southeast of Sarepta. It continued for 15 miles in Pontotoc County. In Calhoun County, one man was killed in Randolph when his mobile home was destroyed. Elsewhere in Randolph, two homes were damaged, and four people were injured by airborne debris. Ten barns were destroyed and two horses were killed. Average path width was 125 yards. M50MH

#### **Pontotoc County**

2 SW Robbs to 01 0100CST 15 200 0 0 1.5M 300K Tornado (F1) 2 W Sherman 0125CST

A tornado spun up in the western part of Calhoun County in the village of Shepherd and tracked northeast, crossing into Pontotoc County 2 miles southwest of Robbs at 0100 CST. It continued for 15 miles to a point about 2 miles west of the city of Sherman. Luckily, there were no fatalities or injuries in Pontotoc County. However, nine homes sustained moderate damage, and one mobile home was destroyed in or near the village of Robbs. In addition, fifteen barns were destroyed, two horses were killed, and several fields of corn were damaged. Average path width was 125 yards.

Pontotoc Co	ounty					
2 W Pontoto	oc 01	0052CST	0	0		Hail (0.75)
Pontotoc Co	ounty					
Pontotoc	01	0057CST	0	0	10K	Thunderstorm Wind (G50)
		0002CST				

Trees and power lines were blown down. Two vehicles sustained tree damage.

31.2.3 <u>Examples of CWFA Boundary-crossing Tornado</u>. WFOs must coordinate the beginning and ending locations of tornadoes that move from one CWFA into another. This will assure that all affected counties/parishes are mentioned. In the following example, both segments mention that the tornado crossed from one county/parish into another one.

#### **TEXAS, North**

#### **Cooke County**

4 NW Gainesville to 6 N Gainesville

A tornado touched down 4 miles northwest of Gainesville. It then moved into Love County, Oklahoma, 6 miles north of Gainesville (see *Storm Data* for Oklahoma, Western, Central and Southeast). In Cooke County, a mobile home and a storage pole barn were heavily damaged northwest of Gainesville. Average path width for the Texas portion was 75 yards.

#### OKLAHOMA, Western, Central, and Southeast

#### **Love County**

**5 S Thackerville to 3 ESE Thackerville** 

11 0258CST 5 100 0 0 100K 100K Tornado (F1) 0304CST

This tornado developed in Cooke County, Texas, about 4 miles northwest of Gainesville, and tracked northeastward before crossing the Red River into Love County in Oklahoma (see *Storm Data* for Texas, North, for more information on the beginning portion of this tornado in Texas) at 0258 CST at a point 3 miles east-southeast of Thackerville. In Oklahoma, the most significant damage, rated F1, occurred 3 miles southeast of Thackerville where a barn was destroyed, and some soy bean crop was uprooted. Nearby, a mobile home was severely damaged with debris scattered for 2 miles. Average path width for the Oklahoma portion was 50 yards.

- 31.3 Multiple Tornadoes in One Episode.
- 31.3.1 <u>Examples of Grouping Multiple Tornadoes</u>. In the example below, if there are multiple tornadoes in one severe weather episode, each tornado has its own narrative. In addition, if the tornadoes are not separated by a large time span, they can be entered together as a group in one episode. This will keep them separated from other severe weather events for easier publication reading.

#### **Sevier County**

7 SW DeQueen to 23 1557CST 9.7 50 0 0 Tornado (F1) 4 SE DeQueen 1620CST

This tornado occurred over a wooded region with few homes or structures in the area.

**Tropical Depression** 

0 0

**TXZ183** 

Val Verde 23 2200CST

1000CST

Tropical Depression Two and its remnants stalled over the Big Bend area and produced up to 18 inches of rain in Del Rio. Winds gusts of 35 knots (40 mph) and minimum sea-level pressure of 1015 mb were reported at Del Rio. The main effect of T.D. #2, namely flash flooding on San Felipe Creek, resulted in 9 fatalities (drownings), 150 injuries, \$40.0M in property damage, and around \$100K in crop damage.

33. **Tropical Storm (Z).** A tropical cyclone with 1-minute sustained wind speeds of 34 to 63 knots (39 to 73 mph). The tropical storm should be included as an entry when its effects, such as wind, storm surge, freshwater flooding, and tornadoes, are experienced in the WFO's CWFA, including the coastal waters. The center of the tropical storm may not actually move ashore and tropical storm-force winds may not actually be observed in the CWFA.

The tropical storm will usually include many individual hazards such as storm surge, freshwater flooding, tornadoes, rip currents, etc. Refer to Section 3.6 for detailed information on how and what to encode with regards to the tropical storm event, as well as its associated individual hazards.

Beginning Time - When the direct effects of the tropical storm were first experienced.

Ending Time - When the direct effects of the tropical storm were no longer experienced.
 Direct Fatalities/Injuries
 Casualties caused by storm surge, rough surf, freshwater flooding, or wind-driven debris or structural collapse.
 Wind caused a tree to blow onto someone.
 Someone drowned while surfing in rough waters.
 Someone drowned when flood waters swept a vehicle into a river.
 Indirect Fatalities/Injuries
 Someone suffered a heart attack while removing debris.
 Someone was electrocuted by touching downed power lines.
 Someone drowned when a vehicle was driven into a canal.
 Someone was killed in a vehicle accident caused by a tropical storm-related missing traffic signal.

#### Example:

Tropical Storm Helene made landfall near Fort Walton Beach during the late morning hours of September 22. Storm total rainfall ranged from a half inch at Perry to 9.56 inches at Apalachicola. The highest sustained wind of 39 knots (45 mph) with a peak gust of 56 knots (65 mph) was recorded at Cape San Blas. The lowest sea-level pressure was 1011 mb at Panama City. Coastal storm tides of 2 feet or less above astronomical tide levels were common, with only minor beach erosion reported. Near the coast, as well as inland, many properties,

homes, and businesses sustained wind damage. No fatalities or injuries were attributed to the winds. All of the associated effects of Helene resulted in 4 fatalities, 13 injuries, \$3.5M in property damage, and around \$1.0M in crop damage. Specifically, Helene's flood waters in the Florida Panhandle resulted in 2 fatalities, 3 injuries, \$1.0M in property damage, and \$750K in crop damage. The nine associated tornadoes resulted in 2 fatalities, 10 injuries, \$1M in property damage, and \$150K in crop damage. The powerful winds caused \$1M in property damage and \$100K in crop damage. The storm surge along the coast resulted in \$500K in property damage.

34. **Tsunami (Z)**. An ocean wave produced by a sub-marine earthquake, landslide, or volcanic eruption, resulting in a fatality, injury or damage. When the wave reaches the coast, a tsunami may appear as a rapidly rising or falling tide, a series of breaking waves, or even a bore.

Ending Direct F  Indirect	Ing Time - When the water lever Time - When the water lever Tatalities/Injuries  A coastal dwelling was water A person drowned when vertical triangles  A person suffered a heart and A person died when the home	el retur ashed a vehicle attack	med taway was while	injuring swept ave	ormal.  g or killing the occupants.  way.  ating.

Example:						
WAZ040	Southern Cascade Foothills 10 1800PST 0 0 Volcanic Ash 2100PST  A minor eruption of Mt. St. Helens caused ash to rise about 10,000 feet into the atmosphere. The ash drifted to the southwest and fell in the southern Cascade foothills. State Highway 503 became slippery when it was covered with ash, which caused a head-on collision of two vehicles. One person was killed (indirect fatality) and the other seriously injured (indirect injury).					
36. Waterspout (M). A rotating column of air, pendant from a convective cloud, with its circulation extending from cloud base to water surface over the waters and bays of the ocean, Great Lakes, Lake Okeechobee, or Lake Pontchartrain (those assigned specific Marine Forecast Zones). A vortex over any other water surface will be entered as a tornado. A vortex that moves over both water and land will be characterized as a waterspout for that portion of its path over the water surface (waters and bays of the ocean, Great Lakes, Lake Okeechobee, or Lake Pontchartrain - those assigned Marine Forecast Zones), and a tornado for that portion of its path over land, or inland bodies of water (not assigned Marine Forecast Zones).						
Beginning Time - When a waterspout was first reported in contact with the water.  Ending Time - When a waterspout was last reported in contact with the water.  Direct Fatalities/Injuries  A waterspout capsized a small boat, drowning the occupant.  A waterspout blew a vehicle off a bridge and the driver drowned.  Indirect Fatalities/Injuries  A boater fleeing a waterspout crashed into a breakwater.  A boater suffered a heart attack after sighting a waterspout.						
Examples:						
LMZ654	Port Washington to 18 1835CST 1900CST	North Poin 0	t Ligh 0		Waterspout	

GMZ053 Craig Key to the west end of the 7 mile bridge FL 10 1200EST 0 2 50K Waterspout

north of Milwaukee to near Port Washington.

A large waterspout from the Florida Straits moved across a marina at Marathon damaging three sail boats and injuring two people.

Several waterspouts were spotted over Lake Michigan a few miles offshore from

Examples of a Tornado that Became a Waterspout (Body of Water with Assigned Marine 36.1 Forecast Zone). St. Louis County 28 1651CST 4.4 60 100K Tornado (F1) 2 E Arnold to 0 1655CST 1 S French River A tornado touched down north of Duluth. A barn and an outbuilding were destroyed and trees were damaged. The tornado reached the shore of Lake Superior just south of French River, and then curved northeast as a waterspout moving toward Two Harbors. **LSZ144** 1S French River to 1E Two Harbors 28 1655CST 0 0 Waterspout 1705CST This waterspout initially began as a tornado in St. Louis County near Arnold. It crossed over the Lake Superior shoreline just south of the village of French River, and then curved northeast toward Two Harbors. Luckily, no marinerelated damage was noted. 37. **Wildfire (Z).** Any free burning and (at one time) out of control forest fire, grassland fire, rangeland fire, or urban-interface fire which consumes the natural fuels and spreads in response to its environment. The fire causes a fatality, injury, or significant property or resource damage (including equipment damaged in fighting the fire). Human activities can start wildfires, but they usually occur as a result of, or are exacerbated by, natural phenomena, such as lightning strikes, volcanic eruptions, inordinately dry conditions, and wind. Professional judgment is needed when deciding to include a wildfire in Storm Data. Beginning Time - When a wildfire became out of control. Ending Time - When a wildfire became under control. Direct Fatalities/Injuries ☐ A wildfire swept through a campground. Two campers died when their RV was consumed by fire. A man drove into an evacuated area to try to save belongings from a cabin that was threatened by a wildfire. The man died when fire burned the cabin to the ground. ☐ A vehicle accident where the driver suddenly encountered thick smoke that was unavoidable. (Rare) Indirect Fatalities/Injuries Almost all vehicular accidents caused by reduced visibility due to smoke. Example: MTZ005-006 Missoula/Bitterroot Valleys-Bitteroot 06 1500MST 0 **8M** Wildfire

31 1500MST

Dry lightning and strong winds started fires which spread into urban areas of the southern part of the county. Structural damage from fires occurred from August 6-8, but fires raged to the end of the month with a total of 335,356 acres burned. Sixty-four residences and cabins were destroyed, and five were partially destroyed. A total of 164 outbuildings and 87 vehicles were destroyed.

38. Winter Storm (Z). A winter weather event that satisfies one of the following two categories: (1) significant accumulation of at least two of the following elements: snow, freezing rain, or sleet, that pose a threat to life or property, and meets or exceeds nationally or regionally established warning threshold values; or (2) heavy snow and blowing snow where snow amounts meet or exceed locally defined 12- and/or 24-hour nationally or regionally established warning threshold values and sustained wind or frequent gusts of 22 to 30 knots (25-34 mph) occasionally reducing visibilities to 1/4 mile or less for 3 hours or more.

<u>Beginning Time</u> - The time when the winter storm first posed a threat to life and property. <u>Ending Time</u> - The time when the winter storm no longer posed a threat to life and property.

#### Direct Fatalities/Injuries

- ☐ The weight of snow and ice caused a machine shed roof to collapse, killing a farmer.
- A vehicle slid into a ditch. The driver attempted to find help and died of exposure.

#### Indirect Fatalities/Injuries

☐ A vehicle slid into a ditch, killing the driver.

#### Example:

The new year started off with a major winter storm. A combination of snow, sleet, and freezing rain left about 4 inches of frozen precipitation on the ground across the area. Transportation came to a stop for much of the holiday weekend.

39. **Winter Weather/Mix (Z).** An accumulation of freezing rain or drizzle, sleet, or snow, less than regionally established warning values, but resulting in significant impact on commerce or transportation. Elements may occur singly or in combination. Blowing and drifting snow is also entered as a Winter Weather/Mix event. *Storm Data* preparer must use judgment in determining when a winter weather/mix event is significant enough to enter into *Storm Data*.

<u>Beginning Time</u> - When winter weather began to cause significant impact on commerce or transportation.

Ending Time - When the winter weather no longer posed a significant impact.

Indirect	squall that was unavoidable <u>t Fatalities/Injuries</u>	e. (Ra fatalita ibility slid i	are) ies/inj restri nto a c	litch, killing the driver.

**2000EST** 

A period of snow, totaling 4 to 5 inches, led to numerous accidents and minor injuries across Erie County in northwest Pennsylvania. Fairfield reported 5 inches. Two school buses collided on a snow covered hill just east of town. Wind speeds were in the 9 to 17 kts (10 to 20 mph) range, consequently blowing snow was minor or non-existent.

#### **APPENDIX B - Glossary of Terms**

**County Warning and Forecast Area** (CWFA) - The geographical area of responsibility assigned to a WFO for providing warnings, forecasts, and other weather information.

**Fujita-Scale** - A 0 to 5 rating based on a tornado's intensity, indirectly related to observed damage. Since structural design determines damage, probable wind speeds are associated with each F-scale number.

**Header Strip** - A bold-faced line of text at the beginning of each *Storm Data* entry, providing specific information on the time and character of the weather event. This includes location, beginning and ending times, deaths, injuries, property damage, type of event. In some cases, it also includes the Universal Geographic Code and the magnitude of the event, i.e., hail size and tornado F-scale.

**Saffir/Simpson Hurricane Scale** - A 1 to 5 rating based on a hurricane's intensity. This scale designates sustained wind speeds and estimates potential property damage. It sometimes provides estimated associated storm surge.

**StormDat** - The Paradox-based computer software program documents specifics and narratives of significant weather events. StormDat transfers data from WFOs to the Performance Branch in OCWWS for use in the NWS verification program and to the NCDC for publication of *Storm Data*.

**Storm Data** - NOAA's official publication which documents the occurrence of storms and other significant weather phenomena having sufficient intensity to cause loss of life, injuries, significant property damage, disruption to commerce, and other noteworthy meteorological events.
